Multidimensional arrays, dictionaries, and datetime

OCEAN 215 | Autumn 2020 Ethan Campbell and **Katy Christensen**

Multidimensional array review

```
1 import numpy as np
2
3 array_empty = np.zeros((12,12))
4 print(array_empty)
```

```

Datetime activity

```
# Use this string for the following questions:
datestring = 'October 22, 2020'
```

- 1) Change datestring into a datetime object
- 2) Get the datetime object for 71 days later than datestring
- 3) Create a new string for this future date with the format Year-month-day (use the datetime formatting table in the activity notebook)
- 4) Create an array of datetimes starting on datestring up to (and including) 71 days in the future with a frequency of 1 day

String datetime formatting

Directive	Meaning					
%a	Weekday as locale's abbreviated name.					
		%f	Microsecond as a decimal number, zero-padded on the lef			
%A	Weekday as locale's full name.	% Z	UTC offset in the form +HHMM or -HHMM (empty string if the the object is naive).			
		% Z	Time zone name (empty string if the object is naive).			
8w	Weekday as a decimal number, where 0 is Sunday and 6 is	% j	Day of the year as a zero-padded decimal number.			
	Saturday.	%U	Week number of the year (Sunday as the first day of the week) as a zero padded decimal number. All days in a new year preceding the first Sunday are considered to be in wee 0.			
%d	Day of the month as a zero-padded decimal number.					
%b	Month as locale's abbreviated name.					
		%W	Week number of the year (Monday as the first day of the			
%B	Month as locale's full name.		week) as a decimal number. All days in a new year preced the first Monday are considered to be in week 0.			
		%C	·			
%m	Month of a new modeled designal number	*C	Locale's appropriate date and time representation.			
	Month as a zero-padded decimal number.					
%у	Year without century as a zero-padded decimal number.	%x	Locale's appropriate date representation.			
%Y	Year with century as a decimal number.					
%H	Hour (24-hour clock) as a zero-padded decimal number.					
%I	Hour (12-hour clock) as a zero-padded decimal number.	%X	Locale's appropriate time representation.			
%p	Locale's equivalent of either AM or PM.					
		88	A literal '%' character.			
%M	Minute as a zero-padded decimal number.					
%S	Second as a zero-padded decimal number.					

Datetime activity #2

- 1) Make your birthday (or another day of significance) into a datetime object
- 2) Use today's date and subtract your birthday to find the timedelta object representing how long you've been alive.
- 3) Find out approximately how many seconds you have been alive
